1 - Tokenized bond — register + deposit (T0) 2

2 - Tokenized bond — coupon claim (step k) 3

3 - Tokenized bond — redemption (burn-to-pay) 4

4 - Tokenized bond — graduation (T4) 5

1 - Tokenized bond — register + deposit (T0)

The first transaction: the holder deposits the principal ADA into the vault and the instrument mints the single CIP-113 reference NFT to the holder, recording the published terms and an initial step: 0.

Figure 1: Register + deposit: principal into the vault, reference NFT to the holder

2 - Tokenized bond — coupon claim (step k)

At each deadline the holder claims the step’s coupon. The claim spends and re-outputs the reference NFT, advancing its step so no step can be claimed twice.

3 - Tokenized bond — redemption (burn-to-pay)

A coupon is redeemed by burning it at the vault: the vault validator pays out exactly the ADA the burned coupons name, and nothing else leaves.

Figure 3: Redemption: burn coupons, the vault pays exactly what they name

4 - Tokenized bond — graduation (T4)

From d4 on the holder claims the principal-only coupon and retires the reference NFT. The principal is read from the certificate's datum.
