1 - Tokenized bond — register (T0) 2

2 - Tokenized bond — deposit (unit) 3

3 - Tokenized bond — coupon claim (step k) 4

4 - Tokenized bond — redemption (burn-to-pay) 5

5 - Tokenized bond — graduation (T4) 6

1 - Tokenized bond — register (T0)

The issuer creates the instrument’s registry entry. The vault is assumed already created and funded by the owner (out of scope), and no certificate is minted here — the same register serves every later deposit.

Figure 1: Register: the issuer pins the instrument once; deposits can follow

2 - Tokenized bond — deposit (unit)

Anyone deposits one bond unit: the principal ADA moves into the vault and the same transaction mints that depositor's CIP-113 reference NFT, recording the published terms and an initial step: 0.

Figure 2: Deposit: one unit of principal into the vault, one reference NFT to the depositor

3 - Tokenized bond — coupon claim (step k)

At each deadline the holder claims the step’s coupon. The claim spends and re-outputs the reference NFT, advancing its step so no step can be claimed twice.

Figure 3: Coupon claim at step k (holder-signed, step-anchored)

4 - Tokenized bond — redemption (burn-to-pay)

A coupon is redeemed by burning it at the vault: the vault validator pays out exactly the ADA the burned coupons name, and nothing else leaves.

Figure 4: Redemption: burn coupons, the vault pays exactly what they name

5 - Tokenized bond — graduation (T4)

From d4 on the holder claims the principal-only coupon and retires the reference NFT. The principal is the deployment’s baked unit amount.

Figure 5: Graduation: claim the principal-only coupon, retire the reference NFT
